

Lab 8 / Final Project Proposal

Please submit a **PDF** document detailing your proposed final project, even if it is from the list of suggestions. This document should be, at most, a page or two and will give us a chance to verify that you've put some thought into your project and that your project (especially if not from the list of suggestions), is of an appropriate difficulty level. In your document, include the following:

- Your name at the top
- Describe your project from a user standpoint: what it does, how the user will interact with it (be specific; rather than “the user can move left or right”, you should think about what I/O they will use to move left or right), etc.
- Include at least a top-level block diagram. This needs to be detailed enough that we can understand how the different blocks of your system interact, but does not have to be super complex.
- If you have any questions or concerns, feel free to put them in the document and we will do our best to answer them in the Gradescope comments.

This submission is not restrictive and you are encouraged to make changes to your approach as you go. If there are any issues with your proposal, we will leave comments detailing what needs to be resolved. You can make these fixes and resubmit up until the final project deadline and earn any lost points back (with the exception of lateness deductions). If you decide to switch your project at any point, you should submit a new proposal and let us know on Piazza through a private post.

As a final note: the lab spec is not extremely detailed and thus is not an exhaustive list of requirements. We also do not have a strict list of requirements for each project, but you should use your best judgment to implement your project at a decently refined level. For example, we will test the reliability of your system during the lab demo; a game should be able to handle rapid, random human inputs without breaking.
